

Amendment to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the applications:

1. (currently amended) A computer-implemented method for restructuring a design model generated by a computer aided design system, the method comprising:
- receiving at a computer a command to restructure the design model, the design model comprising a first hierarchical data structure interrelating a plurality of components and the command to restructure comprising a command to change a hierarchical relationship of a first subset of the plurality of components with respect to other ones of the plurality of components;
- in accordance with the command to restructure, generating a new hierarchical data structure comprising a new hierarchical relationship between the plurality of model components; determining other relationships between components in the first hierarchical data structure ~~hierarchy that are to~~ changed as a result of the command to restructure; and dynamically updating the other relationships to preserve the other relationships subsequent to the generation of the new hierarchical relationship.
2. (currently amended) The method of claim 1 wherein the first hierarchical data structure comprises a plurality of parent-child relationships relating the plurality of components to a common root component, said parent-child relationships detailing a construction of the design model.

SCA
3. (currently amended) The method of claim 2 wherein generating the new hierarchical data structure comprises changing a first hierarchical path between the first subset of the plurality of components and the root component.
4. (currently amended) The method of claim 3 wherein:
the other ones of the plurality of components comprises a first other component;
the other relationships comprise a first other relationship between one of the first subset of components and the first other component; and
~~the~~ a second hierarchical path between the root component and the first other component is not changed as a result of the ~~restructuring~~ command to restructure.
5. (currently amended) The method of claim 4 wherein the first other relationship comprises a mate relationship and dynamically updating the other relationships comprises updating data to maintain the first other relationship ~~data to maintain a mating~~ between the one of the subset of components and the first other components.
6. (currently amended) The method of claims 5 wherein, prior to the receiving the command to restructure ~~of the hierarchy~~, the first subset of the plurality of components is a descendent of the first other components, and subsequent to the restructure, the first subset of the plurality of components is not a descendent of the first other component.
7. (currently amended) The method of claim 4 wherein the first other relationship comprises an update relationship and dynamically updating the other relationships comprises updating data to maintain the update ~~an updating~~ relationship between the one of the first subset of the plurality of components ~~component~~ and the first other component.

GC
8. (currently amended) The method of claim 4 wherein the first other relationship establishes a size relationship between the one of the first subset of the plurality of components and the first other component.
9. (currently amended) The method of claim 4 wherein the first other relationship establishes a positional relationship between the one of the first subset of the plurality of components and the first other component.
10. (currently amended) The method of claim 1 wherein:
generating the new hierarchical data structure comprises generating a component list
identifying a component moving to a new location; and
updating the other relationships comprises generating a reference list identifying the other relationships ~~that are to~~ changed.
11. (currently amended) The method of claim 10 wherein generating ~~a the~~ reference list comprises associating a reference location code with each of the other relationships identified by the reference list, each reference location code identifying a means a change to a relationship to preserve design intent associated with each of the other relationships.
12. (currently amended) The method of claim 1 wherein the first subset of the plurality of components comprise a subassembly of the model.
13. (currently amended) A computer program residing on a computer-readable medium, comprising instructions for causing a computer to

B

receive a command to restructure a design model generated by a computer aided design system, the design model comprising a first hierarchical data structure interrelating a plurality of components and the command to restructure comprising a command to change a hierarchical relationship of a first subset of the plurality of components with respect to other ones of the plurality of components;
in accordance with the command to restructure, generate a new hierarchical data structure comprising a new hierarchical relationship between the plurality of ~~model~~ components;
determine other relationships between the plurality of components in the first hierarchical data structure ~~to hierarchy that are changed~~ as a result of the command to restructure;
and
dynamically update the other relationships to preserve the other relationships subsequent to generation of the new hierarchical data structure relationship by the instructions to generate.

14. (currently amended) The program apparatus of claim 13 wherein the first hierarchical data structure comprises a plurality of parent-child relationships relating the plurality of components to a common root component, said parent-child relationships detailing a construction of the design model.
15. (currently amended) The program apparatus of claim 14 wherein the instructions to generate the new hierarchical data structure comprise instructions to change a first hierarchical path between the first subset of the plurality of components and the root component.
16. (currently amended) The program apparatus of claim 15 wherein:
the other ones of the plurality of components comprises a first other component;

~~the other relationships comprise a first other relationship between one of the first subset of the plurality of components and the first other component; and
the a second hierarchical path between the root component and the first other component is not changed as a result of the restructuring command.~~

17. (currently amended) The program apparatus of claim 16 wherein the first other relationship comprises a mate relationship and the instructions to dynamically update the other relationships comprise instructions to update ~~the first other relationship~~ data to maintain ~~a mating the mate relationship~~ between the one of the first subset of the plurality of components and the first other components.

18. (currently amended) The program apparatus of claims 17 wherein, prior to receiving the command to ~~the restructure of the hierarchy~~, the first subset of the plurality of components is a descendent of the first other components, and subsequent to the generation of the new hierarchical data structure ~~restructure~~, the first subset of the plurality of components is not a descendent of the first other component.

19. (currently amended) The program apparatus of claim 16 wherein the first other relationship comprises an update relationship and the instructions to dynamically update the other relationships comprises instructions to update data to maintain ~~the update an updating~~ relationship between the one of the first subset of the plurality of components ~~component~~ and the first other component.

20. (currently amended) The program apparatus of claim 16 wherein the first other relationship establishes a size relationship between the one of the first subset of the plurality of components and the first other component.

21. (currently amended) The program apparatus of claim 16 wherein the first other relationship establishes a positional relationship between the one of the first subset of the plurality of components and the first other component.

SC 2
22. (currently amended) The program apparatus of claim 13 wherein:
the instructions to generate the new hierarchical data structure comprise instructions to generate a component list identifying a component moving to a new location; and the instructions to update the other relationships comprises instructions to generate a reference list identifying the other relationships to that are changed.

23. (currently amended) The program apparatus of claim 22 wherein the instructions to generate the a-reference list comprise instructions to associate a reference location code with each of the other relationships identified by the reference list, each reference location code identifying a means a change to a relationship to preserve design intent associated with each of the other relationships.

24. (currently amended) The program apparatus method of claim 13 wherein the first subset of the plurality of components comprise a subassembly of the model.

25. (currently amended) A computer aided ~~design drawing~~ system comprising:
a database comprising a stored design model generated by ~~the a~~ computer aided design system, the design model comprising a first hierarchical data structure interrelating a plurality of components;
an input device to exchange data with a user; and
a processor operatively coupled to the input device, to the database, and to a data storage medium, the data storage medium comprising instructions to configure the processor to:
receive from the input device a command to restructure the design model;
in response to the command to restructure, executing instructions to generate a new hierarchical data structure comprising a new hierarchical relationship by changing a hierarchical relationship of a first subset of the plurality of components with respect to other ones of the plurality of components;
determine other relationships between components in the first hierarchical data structure ~~hierarchy that are to be changed~~ as a result of the command to restructure; and
dynamically update the other relationships to preserve the other relationships subsequent to generation of the new hierarchical data structure relationship.
26. (currently amended) The ~~system program apparatus~~ of claim 25 wherein the first hierarchical data structure comprises a plurality of parent-child relationships relating the plurality of components to a common root component, said parent-child relationships detailing a construction of the design model.
27. (currently amended) The system of claim 26 wherein the instructions to generate the new hierarchical data structure comprise instructions to change a hierarchical path between the first subset of the plurality of components and the root component.

28. (currently amended) The system of claim 27 wherein:

the other ones of the plurality of components comprises a first other component;
the other relationships comprise a first other relationship between one of the first subset of the plurality of components and the first other component; and
a second hierarchical path between the root component and the first other component is not changed as a result of the ~~restructuring~~ command to restructure.

B
29. (currently amended) The system of claim 28 wherein the first other relationship comprises a mate relationship and the instructions to dynamically update the other relationships comprise instructions to update the first other relationship data to maintain a mating between the one of the first subset of the plurality of components and the first other components.

30. (currently amended) The system of claims 29 wherein, prior to the generation of the new hierarchical data structure ~~restructure of the hierarchy~~, the first subset of the plurality of components is a descendent of the first other components, and subsequent to the generation of the new hierarchical data structure ~~restructure~~, the first subset of the plurality of components is not a descendent of the first other component.

31. (currently amended) The system of claim 28 wherein the first other relationship comprises an update relationship and the instructions to dynamically update the other relationships comprises instructions to update data to maintain the update ~~an updating~~ relationship between the one of the first subset of the plurality of components ~~component~~ and the first other component.

32. (currently amended) The system of claim 28 wherein the first other relationship establishes a size relationship between the one of the first subset of the plurality of components and the first other component.

33. (currently amended) The system of claim 28 wherein the first other relationship establishes a positional relationship between the one of the first subset of the plurality of components and the first other component.

B
10
5/10/03
34. (currently amended) The system of claim 25 wherein:
the instructions to generate the new hierarchical data structure comprise instructions to generate a component list identifying a component moving to a new location; and the instructions to update the other relationships comprises instructions to generate a reference list identifying the other relationships to that are changed.

35. (currently amended) The system of claim 34 wherein the instructions to generate ~~a the~~ reference list comprise instructions to associate a reference location code with each of the other relationships identified by the reference list, each reference location code identifying a means change to a relationship to preserve design intent associated with each of the other relationships. The system of claim 25 wherein the first subset of the plurality of components comprise a subassembly of the design model.
